

The pennsylvania clean vehicles program is the next step in meeting future demands for cleaner air quality and better fuel efficiency. we continue to pollute our world, ourselves, and future generations. Are we this blind sighted to see change is evident, yet economical?

Thirty seven counties in pennsylvania don't meet the basic health based federal air quality standards for smog. Tailpipe emmissions from passenger vehicles are responsible for about one third of the smog in pennsylvania. With the modern technology to clean this exhaust we can benefit in numerous ways.

The pennsylvania clean vehicles program allows cleaner more fuel efficient cars into pennsylvania and makes them more readily available for consumers when purchasing new cars. It also protects our current emission standards, which are more stringent than the federal standards this protects the air we breath. In addition, this technology also inhance fuel efficiency by about 30%, which can save consumers money. Consumers choice is the best choice for a healthy economy and allowing this will significantly reduce air pollution, health problems, and begin to reduce our need for oil.

I believe everything possible should be done to keep the pennsylvania clean vehicles program intact and begin to change our future. It is in the best interest of the consumers of pennsylvania to protect the clean vehicles program. Any notion against this would be foolish.
