

mercury pollution is a major concern here in the state of pennsylvania. Mercury is known to be an extreme neuro-toxin and has distinguishable effects at the millionth of a gram.

pennsylvania is the second highest in the nation in airborne mercury emissions. This devastates the natural world and has direct effect of the human community in pennsylvania.

As the state of pennsylvania we should do everything possible to reduce our mercury emissions. Modern technology is available and reductions of mercury levels is mandatory. I support and urge the EQB and the TRRC to approve and implement the state specific rule as quickly as possible.

to reduce mercury
