Subject: Hi, pasteurizing milk causes infertility, and homogenization is linked to heart disease/faulty lipid profile...we choose raw!

Hi, as a family of thriving raw milk drinkers in perfect health, I am writing to you to ask that you disapprove of proposed regulation # 2777 Department of Agriculture 2-160.

Pasteurized milk has been proven to CAUSE infertility after 3 generations in animals. (amongst other, equally devastating health consequences) Currently, because humans have been drinking pasteurized milk for about 3 generations now, please note our current infertility crisis in this country. Seems like the human study has been done de facto, and the results made known in the headlines and the plethora of infertility clinics you see just driving around.

Homogenization is increasingly becoming known as a CAUSE of heart disease/high cholesterol/faulty lipid profiles. Just look at the level of atherosclerosis that is happening, even in children.

I urge you to protect your raw milk farmers!

These proposed regulations have nothing to do with safety per se, they only add unnecessary cost that will make it difficult for them to stay in business. They must be helped, not hindered!!

More and more people are coming to learn the truth of pasteurization/homogenization and are wanting to drink raw milk; the milk our grandparents drank, the milk that humans have thrived on for thousands of years. America's health has declined steadily and swiftly since the onset of pasteurization. Pottenger's study is coming true for humans...TODAY.

Thank You so much, please do the right thing to farmers who are doing it right, the way it ought to be done, the way it was always done, Christina Krisciunas
