Dear Paul;

I wanted to put in some written comments on chapter 59 and see I have waited to the last hour to do so. I will make this brief.

1. I have no problem with the cow SCC going from 1 million to 750,000 it could even go down to 500,000 and I would not have any issues with that. I would however like to see the goat SCC remain at 1 million due to the nature of the milk and the difficult time in counting the slides.
2. I would like to see some sort of program that the permits must go thru on sanitation, where the different type of pathogens come from along with trouble shooting any count what to look for and how to correct the problem.
3. If during the pathogen testing positives are found a report given media is given when the next sample comes back negative then notify the media as to the farm is clears to sell product from that farm.

Thanks for letting me submit these items.
