**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Comissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state-supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

marigrace butela

In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state-supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Robert Volkmar

**From:** Madelyn Quinn [madelyn.m.quinn@lmco.com]  
**Sent:** Thursday, June 03, 2010 1:01 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state-supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Carolyn McCoy

**Sent:** Tuesday, June 01, 2010 4:58 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Comissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Lindsay Edmunds

**Sent:** Tuesday, June 01, 2010 4:46 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Emily Schmidlapp

**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Diane Thomas

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

**From:** Gary Dukart [gd36@cornell.edu]  
**Sent:** Tuesday, June 01, 2010 4:29 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Comissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state-supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Nancy Bernstein

**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state-supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

A. Zion

**Sent:** Tuesday, June 01, 2010 4:21 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Jeremiah Ashway

**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Pamela Dixon

In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Steven May

**Sent:** Tuesday, June 01, 2010 5:46 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Comissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state-supplying 43,000 jobs.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Erin Johnson

**Sent:** Tuesday, June 01, 2010 5:26 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Comissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state-supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Helena Kotala

**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Cheryl Locker

**Sent:** Tuesday, June 01, 2010 6:25 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Sarah Barr

In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state-supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

David Fiedler

**From:** Dave Schwartz [davidpschwartz@yahoo.com]  
**Sent:** Tuesday, June 01, 2010 8:32 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state-supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Mark Garvin

**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

Dear Representative,

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Salvatore Carlino  
501 Poplar Street  
Catasauqua, PA 18032

**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Comissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Stephen Kunz

Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Monica Weisberg

**Sent:** Tuesday, June 01, 2010 9:52 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Bruce D. Stephens

**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Ninamary Langsdale  
Glaid

**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Sandra Whipple

Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Donald Stump

**From:** Teresa Cappello [tess@cavtel.net]  
**Sent:** Tuesday, June 01, 2010 10:41 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state-supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Daniel H.L. Gholson

**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Ernest Schwenk

**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Barbara Quintiliano

**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely, ann jackson

In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Rebecca White Newgren

**Sent:** Wednesday, June 02, 2010 9:27 AM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state-supplying 43,000 jobs.

Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,  
Sheryl C. Berger

**Sent:** Wednesday, June 02, 2010 9:02 AM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Jolynn Davis

**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state-supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Troy High

**Sent:** Wednesday, June 02, 2010 7:35 AM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Comissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

John mclaughlin

**Sent:** Wednesday, June 02, 2010 11:26 AM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Theodore Towns

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

**From:** Elizabeth Guldán [edguldán@yahoo.com]  
**Sent:** Wednesday, June 02, 2010 12:12 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Debra West

**Sent:** Wednesday, June 02, 2010 4:34 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Elise Carr

**Sent:** Wednesday, June 02, 2010 9:14 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Sue Schwartz

**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Robert Alspaugh

In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Kathryn Sklar

**Sent:** Thursday, June 03, 2010 8:38 AM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Ed McGrath

**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

theresa camerota

**From:** John Wallen [wallenengineering@verizon.net]  
**Sent:** Wednesday, June 02, 2010 2:38 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Comissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I believe the buffer should be 1000 feet, but 150 ft is a start. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 100 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 50 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Jack and Karen Humphrey  
210 Selkirk Rd  
Williamsport, PA 17701

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,  
Sandra Lehan

**From:** Norman Baglini [sidbaglini@comcast.net]  
**Sent:** Wednesday, June 02, 2010 2:19 PM  
**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

DEP's proposal of 500 mg/L for Total Dissolved Solids (TDS) and 250 mg/L each for Sulfates and Chlorides will go a long way towards ensuring that federal drinking water standards are met across the state for TDS. It is critical that any TDS wastewater effluent standard be protective of aquatic life. We strongly encourage IRRC to approve the standards and to preserve them as discharge standards.

With tourism and recreation serving as major drivers of Pennsylvania's economy, it is critical that we protect the resources these industries depend on: our rivers and streams, especially the EV and HQ streams that stand out as the most attractive for these visitors. In 2008, Pennsylvania's tourism industry provided \$18 billion in wages to more than 600,000 residents. Fishing activities alone generate \$4.7 billion per year in revenue for the state—supplying 43,000 jobs.

Pennsylvania is a water rich state. So rich, in fact, that we have taken our water for granted. This cannot continue. If we continue to tear out all the forest protecting streams and dump millions of gallons of water six-times saltier than the ocean into our waterways, we

will become a state rich with water that isn't any good to anyone. Please approve these regulations on June 17th.

Sincerely,

Stephen Kelly

**To:** IRRC  
**Subject:** Docket #2783 and Docket #2806, Erosion and Sedimentation Control and Wastewater

Commissioners Coccodrilli, Bedwick, Lutkewitte, Mizner, and Fineman:

RE: Docket Number #2783 [EQB 7-440: Erosion and Sedimentation Control]

RE: Docket Number #2806 [EQB 7-446: Wastewater]

Pennsylvania stands to take a major step forward in protecting the health of its rivers and streams. Both of the Environmental Quality Board's actions on Wastewater and Erosion and Sedimentation Control from its May 13, 2010 meeting would take us a long way to preserving a clean and healthy water supply in our state for many years.

I strongly urge you to approve the Environmental Quality Board's proposed revisions to the Chapter 102 regulations, including the section that would mandate 150 foot buffers for new development along Exceptional Value and High Quality streams. I also strongly urge you to approve its new regulations on Wastewater, including the section that requires natural gas drillers to treat their wastewater before they release it into our waterways, to the point that it has no more than 500 milligrams per liter (mg/L) of Total Dissolved Solids (TDS) and 250 mg/L each of Sulfates and Chlorides.

Requiring developers to maintain a buffer of trees and plants alongside our state's best streams is a smart, low-cost solution to protect these important natural resources and the communities and businesses that depend on them. Because buffers take advantage of Pennsylvania's existing natural resources, they deliver significant economic, health and safety benefits with very low investment from taxpayers and businesses.

Buffers filter out pollutants in river water before it becomes drinking water, they reduce the risk of flood damage, increase property values and the tax base, maintain lower stream temperatures and better water quality needed by fish and save Pennsylvania money on stormwater management by using existing natural resources effectively.
