The Gulf disaster should have taught us several valuable lessons. When we are messing with Mother Nature be sure you are cognizant of what catastrophes can occur and how to manage them. Until all this has been scrutinized, there should be no gas well drilling. For example, we know that a person's water supply can be effected 20 miles away from a gas well. It is unrealistic to say that you are responsible to supply water. what is the impact of all the wastewater> The Marcellus Shale follies could make the Gulf Oil disaster look like a minor disaster. The impact of this on the water supply is my most critical concern..,Peter Largey 814-781-6941
