(6) Type of Rulemaking (check applicable box):

☒ Proposed Regulation
☐ Final Regulation
☐ Final Omitted Regulation

☐ Emergency Certification Regulation;
  ☐ Certification by the Governor
  ☐ Certification by the Attorney General

(7) Briefly explain the regulation in clear and nontechnical language. (100 words or less)

The proposed amendments to Chapter 84 would adopt new mortality tables for use in determining the minimum reserves that insurers must maintain for annuities and pure endowment contracts ("annuities"). These new minimum standards would apply to annuities issued on or after the effective date of adoption of the proposed amendments. The proposed amendments are based upon changes to National Association of Insurance Commissioners (NAIC) Model Regulation 821, which were adopted by the

NAIC in 2012. The 2012 Individual Annuity Mortality Table was developed by the Society of Actuaries and the American Academy of Actuaries in cooperation with the Life Actuarial Task Force and reflects improved mortality experience resulting from increased life expectancies. The new table is a generational table that incorporates projections for future mortality improvements. In other words, because people are living longer, mortality tables must be updated in accordance therewith so that insurers can maintain accurate reserves. As such, increased reserving will increase insurer solvency and thereby protect consumers by ensuring reliable payment of benefits when due.

(8) State the statutory authority for the regulation. Include specific statutory citation.

Sections 206, 506, 1501 and 1502 of The Administrative Code of 1929 (71 P.S. §66, 186, 411 and 412), regarding the general rulemaking authority of the Pennsylvania Insurance Department ("Department"); sections 301 and 303 of The Insurance Department Act of 1921 (40 P.S. §71 and §73), regarding computation of reserve liability and minimum reserve requirements of companies charging less than net premiums computed on mortality tables; and section 401A of The Insurance Company Law of 1921 (40 P.S. §510.1) regarding standard nonforfeiture law for life insurance.

(9) Is the regulation mandated by any federal or state law or court order, or federal regulation? Are there any relevant state or federal court decisions? If yes, cite the specific law, case or regulation as well as, any deadlines for action.

These amendments are not mandated by any federal or state law or court order or federal regulation. There are no relevant state or federal court decisions.

(10) State why the regulation is needed. Explain the compelling public interest that justifies the

regulation. Describe who will benefit from the regulation. Quantify the benefits as completely as possible and approximate the number of people who will benefit.

The Department's adoption of the proposed mortality tables will help to ensure the solvency of insurance companies by requiring adequate and accurate reserves based on the most recent mortality tables. Since the proposed rulemaking concerns the solvency requirements applied to insurers, the public will benefit to the extent the rulemaking promotes a financially sound insurance industry that has the ability to fulfill its contractual obligations under insurance policies. Additionally, the adoption of the amendments will promote consistency with other states, at least 36 of which have adopted substantially similar amendments to their corresponding regulations.

(11) Are there any provisions that are more stringent than federal standards? If yes, identify the specific provisions and the compelling Pennsylvania interest that demands stronger regulations.

There are no federal standards applicable to the substance of these proposed amendments.

(12) How does this regulation compare with those of the other states? How will this affect Pennsylvania's ability to compete with other states?

At least 36 other states have adopted amendments substantially similar to those in this proposed rulemaking. Pennsylvania domestic insurers issuing annuities may suffer adverse tax consequences if the

proposed amendments are not adopted in Pennsylvania. Once at least 26 states adopted the amendments, federal tax law recognized the new mortality tables for tax reserves. If Pennsylvania does not adopt the new mortality tables, Pennsylvania domestic insurers may experience unfavorable tax treatment as compared to insurers domiciled in other jurisdictions that have adopted the new tables.

(13) Will the regulation affect any other regulations of the promulgating agency or other state agencies? If yes, explain and provide specific citations.

These proposed amendments will not affect other regulations of the Department or other state agencies.

(14) Describe the communications with and solicitation of input from the public, any advisory council/group, small businesses and groups representing small businesses in the development and drafting of the regulation. List the specific persons and/or groups who were involved. ("Small business" is defined in Section 3 of the Regulatory Review Act, Act 76 of 2012.)

The Department circulated exposure drafts of the regulations to the Insurance Federation of Pennsylvania, Inc., the American Fraternal Alliance and the Pennsylvania Fraternal Alliance. Comments received were carefully considered and incorporated into the proposed rulemaking.

(15) Identify the types and number of persons, businesses, small businesses (as defined in Section 3 of the Regulatory Review Act, Act 76 of 2012) and organizations which will be affected by the regulation. How are they affected?

The proposed rulemaking would apply to life insurance companies, including fraternal benefit societies, issuing annuities in this Commonwealth. As further explained below, some of these insurers would be considered Pennsylvania "small businesses."

(16) List the persons, groups or entities, including small businesses, that will be required to comply with the regulation. Approximate the number that will be required to comply.

All life insurance companies and fraternal benefit societies issuing annuities in the Commonwealth will be required to comply with the regulation. There are 467 life insurance companies and 56 fraternal benefit societies that are authorized to issue annuities in Pennsylvania.

(17) Identify the financial, economic and social impact of the regulation on individuals, small businesses, businesses and labor communities and other public and private organizations. Evaluate the benefits expected as a result of the regulation.

Although it is not possible to quantify the exact cost that would be incurred by an insurer implementing the new mortality tables, the proposed rulemaking may have some adverse fiscal impact on insurance companies marketing annuity contracts. Specifically, insurers may be required to expend the time necessary to determine if their current annuity reserve standards meet the new requirements. To the extent that the standards do not comply with the new requirements, an insurance company would need to increase the reserves for contracts issued on or after the effective date of adoption of the proposed

amendments to Chapter 84. Finally, insurers may incur costs to upgrade their technological and actuarial services. Costs of compliance with the proposed amendments will vary by insurer.

The proposed amendments will strengthen insurer solvency by providing for more accurate reserves. Specifically, the proposed rulemaking will benefit consumers by ensuring that insurers will be financially able to pay benefits on annuities. Consumers are living longer, and insurers must be prepared to pay benefits for a longer period of time. Additionally, because the new table is a generational table, it contains factors that will adjust the mortality rates *annually* based on expected mortality improvements. This will improve the long-term accuracy of the new table in lieu of a static table, which can become dated more quickly than a generational table.

(18) Explain how the benefits of the regulation outweigh any cost and adverse effects.

Any costs incurred by insurers in complying with this proposed rulemaking would be outweighed by the benefit to consumers of holding policies from a more financially solvent insurer. Additionally, any negative fiscal impact would be minimized by requiring the new table be used only for contracts issued after the effective date of the regulation.

(19) Provide a specific estimate of the costs and/or savings to the **regulated community** associated with compliance, including any legal, accounting or consulting procedures which may be required. Explain how the dollar estimates were derived.

Because costs of compliance with the proposed rulemaking will vary from insurer to insurer, it is not feasible for the Department to quantify the exact cost that would be incurred by an insurer implementing the new mortality tables. Costs will vary based upon the insurer's existing reserving practices, as well as

the insurer's necessity to update current systems to accommodate the application of the new tables.

(20) Provide a specific estimate of the costs and/or savings to the **local governments** associated with compliance, including any legal, accounting or consulting procedures which may be required. Explain how the dollar estimates were derived.

This proposed rulemaking will not impose any costs and/or savings to local governments.

(21) Provide a specific estimate of the costs and/or savings to the **state government** associated with the implementation of the regulation, including any legal, accounting, or consulting procedures which may be required. Explain how the dollar estimates were derived.

This proposed rulemaking will not impose any costs and/or savings to state government.

(22) For each of the groups and entities identified in items (19)-(21) above, submit a statement of legal, accounting or consulting procedures and additional reporting, recordkeeping or other paperwork, including copies of forms or reports, which will be required for implementation of the regulation and an explanation of measures which have been taken to minimize these requirements.

The proposed rulemaking does not impose any additional reporting, recordkeeping or paperwork upon the regulated community. It is possible that actuarial services may be required for the implementation of the new mortality tables, but it is not possible to quantify the extent to which required. These requirements have been minimized by requiring application of the new tables for contracts issued only after the effective date of the amendments.

(23) In the table below, provide an estimate of the fiscal savings and costs associated with implementation and compliance for the regulated community, local government, and state government for the current year and five subsequent years.

	Current FY Year	FY +1 Year	FY +2 Year	FY +3 Year	FY +4 Year	FY +5 Year
SAVINGS:	$	$	$	$	$	$
Regulated Community						
Local Government						
State Government						
Total Savings						
COSTS:						
Regulated Community						
Local Government						
State Government						
Total Costs						
REVENUE LOSSES:						
Regulated Community						
Local Government						
State Government						
Total Revenue Losses						

(23a) Provide the past three year expenditure history for programs affected by the regulation.

Program	FY -3	FY -2	FY -1	Current FY

(24) For any regulation that may have an adverse impact on small businesses (as defined in Section 3 of the Regulatory Review Act, Act 76 of 2012), provide an economic impact statement that includes the following:

   (a) An identification and estimate of the number of small businesses subject to the regulation.
   (b) The projected reporting, recordkeeping and other administrative costs required for compliance with the proposed regulation, including the type of professional skills necessary for preparation of the report or record.
   (c) A statement of probable effect on impacted small businesses.
   (d) A description of any less intrusive or less costly alternative methods of achieving the purpose of the proposed regulation.

Small businesses subject to the regulation

As stated above, there are 467 life insurance companies and 56 fraternal benefit societies that are authorized to issue annuities in Pennsylvania.

The Department reviewed the standards set forth by 13 CFR § 121.201 and the U.S. Small Business Administration Table of Small Business Size Standards Matched to North American Industry Classification System (NAICS) Codes to determine the applicability of this rulemaking to Pennsylvania small businesses. The standards for small business classification vary by type of business written as follows:

Subsector 524 – Insurance Carriers and Related Activities		
524113	Direct Life Insurance Carriers	$7.0 million annual receipts
524114	Direct Health and Medical Insurance Carriers	$7.0
524126	Direct Property and Casualty Insurance Carriers	1,500 employees
524127	Direct Title Insurance Carriers	$7.0
524128	Other Direct Insurance (except Life, Health and Medical) Carriers	$7.0
524130	Reinsurance Carriers	$7.0
524210	Insurance Agencies and Brokerages	$7.0
524291	Claims Adjusting	$7.0
524292	Third Party Administration of Insurance and Pension Funds	$7.0
524298	All Other Insurance Related Activities	$7.0

As per these standards, "Direct Life Insurance Carriers" with less than $7 million in annual receipts qualify as "small businesses." There are 26 "Direct Life Insurance Carriers" domesticated in Pennsylvania that will be subject to this regulation. According to publicly available annual statement

data, there are two domestic Direct Life Insurance Carriers with less than $7 million in annual receipts that would meet the definition of "small business."

Additionally, there are 20 fraternal benefit societies domesticated in Pennsylvania, 13 of which would meet the definition of "small business."

Projected costs of compliance and probable effect on impacted small businesses

The proposed rulemaking does not impose any reporting or recordkeeping requirements on the regulated community. An insurer may incur administrative cost in attaining compliance with the proposed rulemaking, and may need to employ actuarial services as necessary to determine to what extent reserves need to be increased. However, because insurers utilize actuarial services in the normal course of business, it is not possible to quantify the extent of additional services required, if any.

Alternative methods

The Department is unaware of any less intrusive or less costly alternative methods for achieving the purpose of the amendments, which is to provide requirements for more accurate annuity reserves based upon decreased mortality of individuals.

(25) List any special provisions which have been developed to meet the particular needs of affected groups or persons including, but not limited to, minorities, the elderly, small businesses, and farmers.

No provisions were developed to meet the particular needs of minorities, the elderly, small businesses, or farmers.

(26) Include a description of any alternative regulatory provisions which have been considered and rejected and a statement that the least burdensome acceptable alternative has been selected.

No alternative regulatory provisions were considered. There is no less burdensome acceptable alternative to the adoption of new mortality tables for use in determining the minimum reserves that insurers must maintain for annuities.

(27) In conducting a regulatory flexibility analysis, explain whether regulatory methods were considered that will minimize any adverse impact on small businesses (as defined in Section 3 of the Regulatory Review Act, Act 76 of 2012), including:

a) The establishment of less stringent compliance or reporting requirements for small businesses;
b) The establishment of less stringent schedules or deadlines for compliance or reporting requirements for small businesses;
c) The consolidation or simplification of compliance or reporting requirements for small businesses;
d) The establishment of performing standards for small businesses to replace design or operational standards required in the regulation; and
e) The exemption of small businesses from all or any part of the requirements contained in the regulation.

The Department did not consider regulatory methods to minimize adverse impact on small businesses. The increase in reserves required by the new tables is necessary to ensure financial solvency regardless of the size of the insurer issuing the annuity. Consumers that purchase annuities from smaller insurers should be provided the same assurances that their benefits be paid as those who contract with larger insurers. Also, it should be noted that the Department does not have the statutory authority to grant an exemption of small businesses from all or any part of the requirements of the proposed amendments.

(28) If data is the basis for this regulation, please provide a description of the data, explain in detail how the data was obtained, and how it meets the acceptability standard for empirical, replicable and testable data that is supported by documentation, statistics, reports, studies or research. Please submit data or supporting materials with the regulatory package. If the material exceeds 50 pages, please provide it in a searchable electronic format or provide a list of citations and internet links that, where possible, can be accessed in a searchable format in lieu of the actual material. If other data was considered but not used, please explain why that data was determined not to be acceptable.

This proposed rulemaking is based upon a model regulation developed by the NAIC. The changes developed by the NAIC to the mortality tables are based upon a 2011 report, requested by the NAIC's Life Actuarial Task Force (LATF), from the joint American Academy of Actuaries/Society of Actuaries Payout Annuity Table Team. The report documents the data, assumptions and process the Team used to develop the 2012 Individual Annuity Reserve Table (2012 IAR Table). The attached report explains how the data meets relevant acceptability standards in the actuarial community and documents the data, assumptions and process used to develop the new tables.

(29) Include a schedule for review of the regulation including:

    A. The date by which the agency must receive public comments: _____

    B. The date or dates on which public meetings or hearings
       will be held: _____

    C. The expected date of promulgation of the proposed
       regulation as a final-form regulation: _____

    D. The expected effective date of the final-form regulation: _____

    E. The date by which compliance with the final-form
       regulation will be required: _____

    F. The date by which required permits, licenses or other
       approvals must be obtained: _____

(30) Describe the plan developed for evaluating the continuing effectiveness of the regulations after its implementation.

The Department reviews each of its regulations for continued effectiveness on a triennial basis.

NOTICE OF PROPOSED RULEMAKING
INSURANCE DEPARTMENT

31 Pa. Code Chapter 84

**TABLES APPROVED FOR USE IN DETERMINING
MINIMUM NONFORFEITURE STANDARDS AND MINIMUM
STANDARDS FOR VALUATION**

PROPOSED RULEMAKING

INSURANCE DEPARTMENT

31 PA. CODE Ch. 84

Tables Approved for Use in Determining Minimum Nonforfeiture Standards and Minimum Standards for Valuation

[__ Pa.B. ____]
[Saturday, _____, 201_]

The Insurance Department (Department) proposes to amend Chapter 84 (relating to tables approved for use in determining minimum nonforfeiture standards and minimum standards for valuation) to read as set forth in Annex A. The rulemaking is proposed under the authority of: sections 206, 506, 1501 and 1502 of The Administrative Code of 1929 (71 P.S. §§ 66, 186, 411 and 412), regarding the general rulemaking authority of the Department; sections 301 and 303 of The Insurance Department Act of 1921 (40 P.S. §§ 71 and 73), regarding computation of reserve liability and minimum reserve requirements of companies charging less than net premiums computed on mortality tables; and section 410A of The Insurance Company Law of 1921 (40 P.S. §510.1) regarding standard nonforfeiture law for life insurance.

Purpose

The purpose of the proposed amendments to Chapter 84 is to adopt new mortality tables for use in determining the minimum reserves that insurers must maintain for annuities. These new minimum standards would apply to annuities issued on or after the effective date of adoption of the proposed amendments. The proposed amendments are based upon changes to National Association of Insurance Commissioners (NAIC) Model Regulation 821, which were adopted by the NAIC in 2012. The 2012 Individual Annuity Mortality Table was developed by the Society of Actuaries and the American Academy of Actuaries in cooperation with the Life Actuarial (A) Task Force and reflects improved mortality experience resulting from increased life expectancies. The new table is a generational table that incorporates projections for future mortality improvements. In other words, because people are living longer, mortality tables must be updated in accordance therewith so that insurers can maintain accurate reserves. As such, increased reserving will strengthen insurer solvency and thereby protect consumers by ensuring reliable payment of benefits when due.

The Department's adoption of the proposed mortality tables will help to assure the solvency of insurance companies by requiring adequate and accurate reserves based on the most recent

mortality tables. Additionally, the adoption of the amendments will promote consistency with other states.

Explanation of Regulatory Requirements

The following is a description of the significant features of and changes contained in the proposed rulemaking:

Section 84.2 would be amended to add definitions for generational mortality table, period table, projection scale G2, 2012 IAR Table, and 2012 IAM Period Table.

Section 84.3 would be amended to include the addition of the 2012 IAR Mortality Table, which would be applicable to annuities or pure endowment contracts issued after the effective date of the amendments. The remainder of this section would be renumbered accordingly.

Section 84.3a would be added to set forth the methodology for application of the 2012 IAR Mortality Table and provide examples for calculation of mortality rates.

Appendices I-IV would be added to set forth the 2012 IAM Period Tables and the Projection Scale G2 for both males and females.

External Comments

The Department circulated exposure drafts of the proposed rulemaking to the Insurance Federation of Pennsylvania, Inc., the American Fraternal Alliance, and the Pennsylvania Fraternal Alliance. Comments received were editorial and expressed support for the regulation.

Affected Parties

The proposed rulemaking would apply to life insurance companies and fraternal benefit societies issuing annuity and pure endowment contracts in this Commonwealth.

Fiscal Impact

State Government

There will be no increase in cost to the Department due to the adoption of new annuity tables since the proposed rulemaking does not impose additional requirements on the insurance industry which the Department must monitor for compliance.

General Public

It is unlikely that there will be any adverse fiscal impact on the consumers who purchase annuity contracts. The general public will be purchasing annuity contracts from more financially stable insurers.

Political Subdivisions

The proposed rulemaking will not impose additional costs on political subdivisions.

Private Sector

The proposed rulemaking may have some fiscal impact on insurance companies marketing annuity contracts. Insurers will be required to expend the time necessary to determine if their current annuity reserve standards meet the new requirements. To the extent that the standards do not comply with the new requirements, an insurance company must increase the reserves for contracts issued on or after the effective date of adoption of the proposed amendments to Chapter 84. However, any negative fiscal impact would be minimized by requiring the new tables be used only for contracts issued after the effective date of the regulation.

Paperwork

The proposed rulemaking will not impose additional paperwork on the Department. The regulation will not change an insurer's existing reporting, record keeping, or other paperwork requirements.

Effectiveness/Sunset Date

The proposed rulemaking will become effective 30 days after final adoption and publication in the *Pennsylvania Bulletin* as final rulemaking. The Department continues to monitor the effectiveness of regulations on a triennial basis. Therefore, a sunset date has not been assigned.

Contact Person

Questions or comments concerning this proposed rulemaking may be addressed in writing to Bridget E. Burke, Regulatory Coordinator, 1341 Strawberry Square, Harrisburg, PA 17120, within 30 days after the publication of this proposed rulemaking in the *Pennsylvania Bulletin*. Questions and comments may also be e-mailed to *briburke@pa.gov* or faxed to (717) 772-1969.

Regulatory Review

Under section 5(a) of the Regulatory Review Act (71 P.S. §745.5(a)), on January 11, 2016, the Department submitted a copy of this proposed rulemaking to the Independent Regulatory Review Commission (IRRC) and to the Chairpersons of the House Insurance Committee and the Senate Banking and Insurance Committee. A copy of this material available to the public upon request.

Under section 5(g) of the Regulatory Review Act, IRRC may convey any comments, recommendations or objections to the proposed rulemaking within 30 days of the close of the public comment period. The comments, recommendations or objections must specify the

regulatory review criteria which have not been met. The Regulatory Review Act specifies detailed procedures for review, prior to final publication of the rulemaking, by the Department, the General Assembly and the Governor for comments, recommendations or objections raised.

Table of Contents

I - Background and Scope

The objective of the Payout Annuity Table Team (Team), as requested by the NAIC's Life Actuarial Task Force (LATF), was to produce a new annuity valuation mortality table, including projection scales and margins necessary to make the table suitable for standard valuation purposes for individual annuities. This report documents the data, assumptions and process the Team used to develop the 2012 Individual Annuity Reserve Table (2012 IAR Table). The Team began with data and information from the mortality experience analysis, as described in the Society of Actuaries 2000-2004 Individual Payout Annuity Experience Report, dated April 2009. From this, the Team developed a basic table (2012 IAM Table), projection scale (Scale G2). Lastly, the Team explored various approaches and levels of margin which were discussed and ultimately recommended by LATF. The IAR Table is comprised of these three components, which are discussed throughout this report. In addition, the Team recommended and LATF concluded it made sense to develop a generational mortality table through the use of projection factors. While this represents a departure from previous individual annuitant mortality tables, it overcomes the disadvantage of using a static table that can become dated more quickly than a generational table.

II - Table Development and Approach

The 2000-2004 Payout Annuity Mortality Experience Study includes experience for immediate annuities, annuitizations and life settlement options of individual life insurance and annuity death claims. The experience analyzed excluded substandard annuities, structured settlement annuities and variable payout annuities. The experience represented 16 companies over the exposure period. The aggregated annuitant data (male, female) provided for the periods 2000-2004 included death, exposure (initial exposed to risk) and amount of annual income for ages 50 to 113. The data presented some evidence of selection in the form of lower Actual-to-Expected ratios for non-refund (i.e., life only with no certain period) immediate annuities at higher annual income levels. However, the Team decided that due to the limited data at these higher income levels and the narrow scope of this finding (unique to immediate annuities), it would avoid unnecessary complexity and not seek to differentiate mortality by annual income level.

For the purpose of developing the 2002 experience table, the age range was subsequently limited to ages 50 to 99 due to lack of credible experience at younger and older ages. To account for differences in data (extract) periods by the contributing companies, the death, exposure and amount of annual income data were summed across the 2000-2004 period. This data was then smoothed using a graduation approach which is described in detail in this report. Mortality rates were then developed for ages younger than 50 and older than 95, and further adjustments were made to grade the rates for ages 50 to 65 up to the experience-based rates at age 65. The methods used to develop or extrapolate the mortality rates for ages under 50 and above 95, as well as other refinements and adjustments, are described within this report. See Section IV, Younger and Older Age Adjustments. The result of these efforts was a 2002 experience table.

The next step was to project this table with improvement factors to 2012 to create the 2012 Individual Annuity Mortality Basic Table (2012 IAM Basic Table). Once the decision was reached on the merits of creating a generational mortality table, the Team then proceeded with the development of an improvement scale to be used for years 2013 and beyond. Following the development of this scale, labelled projection Scale G2, a methodology to reflect mortality improvement between 2002 and 2012 was determined. Margin levels were then established and added to the 2012 IAM Basic Table to derive the 2012 IAM Period Table. The 2012 IAR Table consists of this 2012 IAM Period Table along with the use of Scale G2 to project future mortality improvements beyond 2012.

III - Graduation

The Team analyzed various graduation approaches to create a preliminary table and ultimately decided to create a preliminary table using confidence intervals by applying the P-Spline methodology. The Team chose the P-Spline method as it was a practical statistical package designed and used by actuaries for mortality data, the output of the package is a statistically robust fitted life ("best estimate") table and the output provides a measure of uncertainty of the fitted table in the form of confidence intervals.

The P-Spline method was used to fit the dataset and provide a graduated life table with the mortality rates (q_x) weighted by amount of annual income. Initially described by Eilers and Marx[1], P-Splines comprise a subset of a class

3

of (piecewise) polynomial functions. They combine the use of P-Splines and difference penalties (e.g., on the estimated coefficients of a generalized linear regression model) to smooth and provide projections of the data.

The P-Spline application used was made available through a spreadsheet-based modeling tool (CMI Mortality Projection Spreadsheet version 3.0) provided by the Continuous Mortality Investigation Bureau or CMIB (http://www.actuaries.org.uk/research-and-resources/pages/continuous-mortality-investigation).[2] Using the tool, values for q_x (males or females) weighted by amount of annual income were fitted for each age x of the dataset.[3] The surface fit was determined by a combination of the data and the penalty applied. Data smoothing was provided by means of the penalized splines and the log mean values of q_x within the fitted region generated.[4] Ninety-five percent confidence intervals (95% CI) were also calculated for q_x based upon the standard deviations (adjusted for increased uncertainty due to analysis by amount of annual income) of the log mean values of q_x generated by the tool.

This graduation approach resulted in mortality rates generally ranging between 99% and 101% of the best estimate mortality rates for key ages. However, the confidence intervals at the oldest and younger ages were wider, suggesting greater uncertainty. In addition, the resulting mortality rates at the older ages were higher than the Annuity 2000 Basic Table. The P-Spline application breaks down as data becomes limited and less credible, which was the case with the underlying younger and older age experience. Therefore, the Team explored additional methods to derive the mortally rates for the younger and older ages, as discussed in Section IV - Younger and Older Age Adjustments.

A comparison of the actual and smoothed mortality (q_x) values for males and females is provided in Figures 1 and 2, respectively.

Figure 1. Graduated Male Mortality Adjusted by Amount of Annual Income
Figure 2. Graduated Female Mortality Adjusted by Amount of Annual Income
IV - Younger and Older Age Adjustments

The mortality experience at both the younger and older ages was limited. In analyzing the experience, the Team identified that the mortality rates at these ages had little impact on the final reserve. Therefore, the Team compared the results at specific ages to several existing industry tables, including: the 1994 Group Annuity Mortality Basic Table (GAM) projected with Scale AA to 2002 (the mid-point of the payout annuity experience period), the 2008 Valuation Basic RR100 Table (2008 VBT), the Annuity 2000 Basic Table (a2000 Table) and the 2006 U.S. Life Tables. Both the 1994 GAM and the a2000 Table had a reasonable fit for ages 20 and 35; however, the tables exhibited significant divergence from the underlying experience by age 50. In addition, the 1994 GAM was lower than the population mortality (2006 U.S. Life Tables) and the a2000 rates were significantly lower than both the population mortality rates and the more recent life experience table at the highest ages for the male risks.

IV.A - Younger Ages

The Team researched the development of the a2000 Table and predecessor tables and found that the a2000 Table rates, at the younger ages, could reasonably be described as being based on group annuity active life experience from 1939-1947, projected with various mortality improvement scales for almost 60 years.

For attained ages 50-59, the 2000-2004 experience shows ratios to the a2000 Table of 191% for males (245 deaths), and 231% for females (201 deaths). The Team considered that these high ratios might be caused by early retirements due to poor health. Past committees were not concerned about the actual experience for ages 50-59 being significantly higher than the valuation table. The Team attributed this lack of concern to the fact that there was not much payout annuity business at these ages, and the lack of material impact of mortality rates at these ages on the reserves. The lack of material impact at younger ages stems from the fact that annuity reserves are a function of probability of survival, which is near 1 at younger ages. For instance, using the a2000 table, using two times a mortality rate at age 20 (1.10 per 1,000 instead of 0.55 per 1,000) means the probability of survival (or receiving the next payment) would only decrease from 0.99945 to 0.99890, or a 0.055% reduction in actuarial value. In addition, there probably was a desire that the annuity valuation mortality appear consistent with other tables, e.g., life insurance and population life tables. Based on the report for the 1983 IAM Table, the a1983 Committee seemed to desire having the annuity mortality rates generally be lower than ultimate life insurance table mortality.

Table 1 below compares the mortality rates for ages 20, 35 and 50, for the following tables:
1. a2000 Table
2. 1994 GAM Basic projected to 2002 using Projection Scale AA
3. 2008 VBT, Nonsmoker, Ultimate
4. 2006 Social Security Administration (SSA) Experience

Table 1 - Comparison of Mortality Rates (1000qx) at Low Attained Ages

Table	Age 20		Age 35		Age 50	
	Male	Female	Male	Female	Male	Female
a2000 Table	0.55	0.28	0.79	0.52	3.33	1.71
1994 GAM Basic projected to 2002	0.47	0.27	0.88	0.47	2.40	1.34
2008 VBT, NS	0.88	0.31	1.02	0.50	2.48	1.77
2006 SSA	1.34	0.46	1.67	0.90	5.66	3.28

The 1994 GAM Table projected to year 2002 is reasonably close to the a2000 table for ages 20 and 35, and moderately lower at age 50.

The 1994 GAM rates were developed as follows:
- Ages 1-12 are from the 1990 Life Tables published in SSA 107.
- Ages 13-24 are graded up to the age 25 experience rate for the Civil Service Retirement System (CSRS) active life experience.
- Ages 25-50 are the CSRS active life experience.
- Ages 51-65 are weighted averages between CSRS active and retired life experience, with the weights for active lives grading down from age 51 to 65.
- Ages 66+ used group annuity actual experience. There was not a large disconnect between age 65 and 66, and later graduation smoothed the resulting table.
- All the experience rates were projected to 1994 prior to graduation.

After reviewing the various tables, the Team decided to use the 1994 GAM table, projected to 2002 using projection Scale AA for ages 1 through 45, and graded to the graduated (experience-based) rates at age 65. The grading was done such that the mortality rates have a constant percentage increase from age 50 to age 65. Age 0 was set equal to four times the age 1 rate, which was consistent with the approach taken for developing the age 0 mortality for the 2008 VBT.

Tables 2 and 3 below illustrate the development of the 2012 IAM Basic Table rates at younger ages for quinquennial ages for male and female risks, respectively.

Table 2 - Development of Mortality Rates for
2012 IAM Basic Table Male Risks - Select Younger Ages

Male Age	1994 GAM Basic 1000 Q_X	Projection Scale AA	1994 GAM Projected to 2002	Graduated Data	Graded Mortality
5	0.255	2.00%	0.217		0.217
10	0.212	2.00%	0.180		0.180
15	0.371	1.90%	0.318		0.318
20	0.545	1.90%	0.467		0.467
25	0.711	1.00%	0.656		0.656
30	0.862	0.50%	0.828		0.828
35	0.915	0.50%	0.879		0.879
40	1.153	0.80%	1.081		1.081
45	1.697	1.30%	1.528	3.445	1.528
50	2.773	1.80%	2.398	5.520	2.501

65	9.286	0.50%	8.921	8.185	8.185

IV.B - Older Ages

Similar to the analysis for the younger ages, the Team researched the development of the a2000 Table and predecessor tables at the higher ages.

The a2000 Table mortality rates for the higher attained ages were developed as follows:
- As with the rates for the younger ages, the a2000 Table rates are the rates from the 1983 IAM Table projected 17 years using projection Scale G (100% for males and 50% for females). A cubic curve was fitted at the high ages, and rates were graded to 1.0 at age 115.
- The a1983 Table was based on the 1973 Experience Table, which was developed from the Society of Actuaries' 1971-76 experience study. At the older ages, the experience table was graduated with a formula that included a

cubic equation to grade to 1.0 by age 115. These rates were then projected 9.5 years to 1983, using 1.5% annual improvement. These rates were then re-graduated.

The level of improvement assumed in projecting the 1973 Experience Table to the a2000 Table was much higher than the observed mortality improvement in the US population over similar time periods. Table 4 below compares the assumed improvement used in the a1983 and a2000 Tables for select higher ages to the actual population improvement for similar periods of time.

Table 4 - Comparison of Annualized Improvement Rates in U.S Population, the a1983 and a2000 Tables for Select Higher Ages

Basis/Time Period	Male Age				Female Age			
	82	87	92	97	82	87	92	97
U.S. Life 1970-80	1.1%	1.0%	0.9%	0.5%	2.0%	1.8%	1.4%	0.9%
U.S. Life 1980-00	1.0%	0.7%	0.4%	0.2%	0.5%	0.4%	0.3%	0.2%
1973-1983 for a1983	1.5%	1.5%	1.5%	1.5%	1.5%	1.5%	1.5%	1.5%
1983-2000 for a2000	1.3%	1.3%	1.0%	1.0%	0.8%	0.8%	0.6%	0.6%

The Team noted that the actual to expected (A/E) ratios in the 2000-2004 experience study, where the expected basis was the a2000 Table, were relatively high. To understand why this might be, the Team analyzed the population improvement over the same time period versus that assumed in the a2000 Table. At the highest ages, the population improvement appears to have been less than assumed for the a2000 Table and the experience from the 2000-2004 experience study exhibited a similar relationship. For example, for attained ages 95-99, the 2000-2004 experience shows an A/E of 128% for males (1,477 deaths) and 108% for females (3,505 deaths). The Team did not have any other explanation for why the experience data mortality rates would be so much greater than the a2000 Table mortality rates. The Team did review preliminary experience data from 2005 through 2008 and noted a similar relationship to the a2000 Table. Therefore, the Team decided to continue this relationship in the final table.

For the higher ages in the 2012 IAM Table, the Team graduated the underlying experience data using individual age data up to age 99. The results of the graduation, compared to the a2000 Table, ranges from 120% to 130% for males (consistent with data), and 99% to 133% for females (consistent with data overall, but a very steep slope within the age range).

Table 5 below compares the graduated rates at ages 90, 95 and 99 to other predecessor mortality tables.

Table 5 - Comparison of Mortality Rates (1000qx) At High Attained Ages

Table	Age 90		Age 95		Age 99	
	Male	Female	Male	Female	Male	Female
2012 IAM Graduated Data	135.89	107.00	216.65	171.92	304.13	296.03
a2000 Table	124.61	112.76	180.24	174.49	233.37	233.03
1994 GAM Basic projected to 2002	159.25	122.05	247.20	197.05	321.39	273.83
2008 VBT, NS	139.33	104.24	227.67	159.48	306.99	240.15
2006 SSA	177.64	138.94	277.94	226.89	354.02	299.72

Table 6 below examines more closely the female A/E experience for ages 95 to 99. Upon further examination, it appeared that the female A/E ratios might have been skewed upward at and near age 99 by large amount claims. The Team decided the amount-based experience at these highest ages lacked sufficient credibility and did not make further adjustment to the underlying experience.

Table 6 - 2000-04 Experience for Ages 95 to 99

	Male			Female		
Age	A/E by Amount	A/E by Count	# of Deaths	A/E by Amount	A/E by Count	# of Deaths
95	110%	138%	511	95%	118%	1,036
96	156%	142%	385	95%	125%	886
97	144%	143%	268	107%	135%	733
98	121%	156%	203	128%	124%	487
99	99%	130%	112	152%	125%	363

The Team also desired to utilize a method that appropriately extrapolated the mortality for ages above age 99 and decided upon using Kannisto's formula. This formula is similar to the Gompertz formula (where the force of mortality increases by the same percentage amount at all ages), but Kannisto's formula is of the form X/(1+X), so that when mortality is low, the percentage increase in mortality by age is fairly constant, but as mortality becomes large, the increases get smaller. Kannisto's formula has been described as providing the best fit for data from ages 80-95 for a number of countries.[5]

Kannisto's formula was parameterized against the data for ages 80-95 and the rates for ages 96+ were used for the 2002 Experience Table. Table 7 below shows the results of the formula.

Table 7 - Results of Kannisto Extrapolation at Older Ages

	Male Qx Actual	Qx Kannisto	Ratio: Kannisto/ Actual	Increase Kannisto Qx	Female Qx Actual	Qx Kannisto	Ratio: Kannisto/ Actual	Increase Kannisto Qx	Ratio: Female/ Male
Age

100		0.30671		7.0%		0.26642		8.0%	86.9%
101		0.32673		6.5%		0.28654		7.6%	87.7%
102		0.34668		6.1%		0.30692		7.1%	88.5%
103		0.36639		5.7%		0.32739		6.7%	89.4%
104		0.38571		5.3%		0.34777		6.2%	90.2%
105		0.40450		4.9%		0.36790		5.8%	91.0%

Table 8 below compares the resulting graduated rates to the mortality rates for other predecessor tables for select ages 90, 95 and 99.

Table 8 - Comparison of Mortality Rates (1000qx) At High Attained Ages

Table	Age 90		Age 95		Age 99	
	Male	Female	Male	Female	Male	Female
2002 Experience Graduated Table	135.89	107.00	216.65	171.92	304.13	296.03
Kannisto Extrapolation	133.20	105.84	210.96	174.79	286.78	246.73
a2000	124.61	112.76	180.24	174.49	233.37	233.03
1994 GAM Basic projected to 2002	159.25	122.05	247.20	197.05	321.39	273.83
2008 VBT, NS	139.33	104.24	227.67	159.48	306.99	240.15
2006 SSA	177.64	138.94	277.94	226.89	354.02	299.72

The Team decided to use the graduated experience data rates up to age 95 and the Kannisto extrapolated rates for ages 96 and above.

Similar to the 2008 VBT Table, the Team decided to cap the mortality at the oldest ages, but decided upon a rate of 0.400 rather than the 0.450 used in the 2008 VBT. The decision to use 0.400 rather than 0.450 was based on information presented at the Society of Actuaries 2011 Living to 100 Symposium, which suggested there was some evidence that mortality did not end at 0.450 or 0.400 but that the process of aging could be slowed down, which would either increase a person's life span or reduce the impact of disease. Given that the difference in the ultimate mortality rate as these extreme ages has little bearing on the resulting reserve levels, the Team went with the lower level.

V - The 2012 Individual Annuity Mortality Basic Table

The previous sections within this report describe the development of the 2002 experience table. The next step was to project this with improvement factors to 2012 to create the 2012 Individual Annuity Mortality Basic Table (2012 IAM Basic Table). The Team also developed a set of improvement or projection factors to improve mortality beyond 2012.

The improvement factors for 2013 and beyond were developed first. The Team looked at population improvement rates over a number of historical periods. Different sources were considered (Social Security Administration, U.S. Life Tables developed by the Centers for Disease Control and Prevention, and data published by the Human Mortality Database), all of which showed similar results. In addition, the Team compared the historical improvement rates to existing improvement assumptions including Scale AA, Scale G and the recently published improvement rates from the Canadian Institute of Actuaries.[6] Historical improvement in annuity experience would have been preferred, but homogeneous data was not available. Tables 9 and 10 below show a comparison of the various improvement factors for male and female risks, respectively.

Table 9 - Comparison of Mortality Improvement for Various Sources - Male Risks

Male Age	Social Security Improvement Rates - 2010 Trustees Report					Scale AA	Scale G	CIA Proposal
	Actual 1990-2000	Actual 2000-2006	Actual 1990-2006	Forecast 2010-2030	Average SSA 2002-2006

In looking more closely at the historical SSA improvement for the 2000 to 2006 years, the Team identified there was both improvement and dis-improvement from year-to-year. Years 2004 and 2006 showed high improvement for most ages whereas the year 2003 showed dis-improvement. In determining the average mortality improvement, the improvement was not floored at zero, allowing for the dis-improvement to be considered. In addition, the Team discussed whether some of the recent improvement in mortality in the actual SSA data could be explained by cohorts of smokers and ex-smokers being replaced by cohorts of non-smokers. This theory raised several questions such as:

1. Whether the higher level of improvement should be used to adjust the base table to 2012?

2. The point at which to assume a steady state is reached?

3. Whether these higher improvement trends were applicable to annuitants, given that they have a lower starting level of mortality than the population? Also, should the fact that smokers are under-represented in annuity populations be considered in our adjustments?

11

An additional consideration of the Team was that recent group annuity experience from 1993 – 2002 exhibited mortality improvement in line with scale AA. The Team believed that group annuity mortality would be lower than population but would not have the same level of anti-selection as individual annuity mortality.

The Team determined to use the SSA data as its primary source. The SSA had three separate forecasts which represented a low-cost set (Alternative I), an intermediate set (Alternative II) and a high-cost set (Alternative III). The SSA figures reflected in Tables 9 and 10 above are from their intermediate forecast (Alternative II).

The Team considered the actual SSA improvement rates for the period 1990-2006, as well as the average improvement rates assumed by the SSA in their 2010 Trustees report for years 2012-2022, and developed a set of improvement factors that are equal to or slightly (0.1% to 0.4%) higher than the SSA 2012-2022 improvement factors for ages 50-95. (Note: Based upon clarification of approach from discussions with SSA actuaries and supported by various research and emerging experience, the Team determined the SSA improvement for ages 65+ to be too conservative (i.e., low) for an annuity valuation table.) Therefore, an additional improvement level of 0.4% for ages 65 to 82 and 0.2% for ages 87+ was added. The adjustment to the improvement was graded from 0.4% to 0.2% between ages 82 and 87. This adjustment was the same for males and females. For younger ages, a simple 1% assumption was made. For older ages, the improvement rates grade to zero at age 105. The Team has named the improvement Scale G2, as it replaces Scale G as the scale used for individual annuity valuation. Scale G2 is shown in Table 11, below. Table 12 compares the annualized improvement in Scale G2 to that of the U.S. Life Tables over various time periods.

Table 11 - Scale G2

| | G2 Improvement | |
Age	Male	Female
<50	1.0%	1.0%
50	1.0%	1.0%
60	1.5%	1.3%
80	1.5%	1.3%
90	0.7%	0.6%
100	0.2%	0.2%
105	0.0%	0.0%

To create the 2012 IAM Basic Table, the Team projected the 2002 experience table for four years using actual SSA improvement from 2002 to 2006 (where 2002 is the mid-point of the underlying 2000-04 experience data, consistent with the experience study used to create the 2002 experience table). The Team looked at limited population data that indicated that population improvement rates from 2006 to 2009 were not inconsistent with Scale G2; therefore, the Team projected the rates from 2006-2012 (six years) using Scale G2. Tables 13 and 14 below show the actual SSA improvement rates for 1990 through 2006 and 2002 through 2006, and the SSA assumed improvement rates for 2012 through 2022, Scale G2, the 2002 experience table rates and the 2012 IAM Basic Table rates for male and female risks, respectively. Also, please see Exhibit I for the 2012 IAM Basic Table rates.

14

Table 15 below contains the analysis for the 2012 IAM Table and the impact of the projection scale 40 years out, to 2052. The 2012 table results in mortality rates, which, at key ages, are significantly lower than those in the a2000 Table, even without future improvement. For example, male rates are 33% lower at age 75 and 18% lower at age 85.

Table 15 - Relationship of 2012 IAM Table
with and without Projection to a2000 Table and Female to Male

VI - The 2012 Individual Annuity Mortality Period Table

The 2012 IAM Period Table is the 2012 IAM Basic Table with the margins as determined by LATF, but without future projection. To develop the margins, the Team reviewed the approach taken for developing the margins used in the a2000 Table and discussed with LATF whether there was a need to vary the approach to determining the margin or the actual level of margin from that used in developing the a2000 Table, with a recommendation that the Team did not see a compelling reason to vary. LATF agreed no changes in the approach or level of margin were required. Thus, the resulting margin recommended by LATF is 10% for all ages up to and including 100. The margin then grades down 1% per year for ages 100 until the ultimate mortality cap of 0.40000 is invoked. This results in a margin of zero beginning at age 106 for males and 108 for females. The table omega is 120 where the mortality rate is set to 1.00000. The Team determined there was no need to smoothly grade from 0.40000 to 1.00000 as there was little difference on the impact of reserves. See Exhibit II for the 2012 IAM Period Table.

VII - The 2012 Individual Annuity Reserve Table and Projection Factors

To develop the 2012 Individual Annuity Reserve Table (2012 IAR Table), the Team concluded it made sense to create a generational mortality table through the use of projection factors. These projection factors are applied to the table each valuation year, rather than using a static table which can become dated more quickly. The Team used the same approach as for the improvement factors described in Section VI of this report. For future projection, the Team decided to use Scale G2, without further modification. An example of the development of a generational mortality table through application of projection factors is shown in Exhibit IV.

VIII - Validation of 2012 IAM Table

In order to test the overall fit of the resulting table to the underlying 2000-2004 experience, the Team back-tested the table by recalculating the A/E ratio where the expected basis was the 2012 IAM Table (i.e., without margin) adjusted to 2002, the mid-point of the underlying experience. The purpose of this test was to ensure that the resulting table, after the various adjustments, graduation and smoothing compared to the underlying experience as the Team intended. The Team observed the overall fit to be quite good at the core ages (i.e., 65 through 95) and somewhat less at other ages, where different data was used. The Team concluded this was appropriate and the results of the back-testing did not warrant additional modification to the table. Table 16 below shows the results of the back-testing.

Table 16 - Comparison of 2012 IAM Basic Table
(Adjusted to 2002) to 2000-2004 Experience

Attained Age Group	Male A/E Ratio	Female A/E Ratio
60 - 64	111%	112%
65 - 69	100%	103%
70 - 74	100%	102%
75 - 79	100%	99%
80 - 84	100%	100%
85 - 89	100%	102%
90 - 94	101%	100%
95 - 99	107%	105%

In addition, the Team tested the 2012 IAM Table to the preliminary 2005-2008 experience data. The Team determined there was no evidence to suggest withholding the introduction of the 2012 Table in order to obtain more data. Table 17 shows the results of the testing against the 2005-2008 preliminary experience data. The Expected basis is the 2012 IAM table (i.e., without margin) adjusted to January 1, 2007, the mid-point of the underlying experience.

Table 17 - Comparison of 2012 IAM Basic Table
(Adjusted to January 1, 2007) to Preliminary 2005 - 2008 Experience

Attained Age Group	Male A/E Ratio	Female A/E Ratio
60 - 64	110%	129%
65 - 69	94%	99%
70 - 74	105%	99%
75 - 79	102%	103%
80 - 84	104%	98%
85 - 89	102%	96%
90 - 94	107%	105%
95 - 99	99%	107%

IX - Impact to Reserves

The Team analyzed the impact of the 2012 Individual Annuity Reserve (2012 IAR) Table, which includes both the projection factors and margin, to the current a2000 Table, as well as to annuity reserves. Figures 3, 4, 5 and 6 below compare the mortality rates per 1,000 of the 2012 IAM Table, the 2012 IAR Table to the a2000 Table and a2000 Valuation Table.

Figure 3

**Female Risks, Ages 65-90**

Figure 8
Mortality Rate per 1,000 Comparison
Proposed 2012 Table to a2000 Table
Female Risks, Ages 91-115

The Team also prepared sample reserve calculations using 5% interest and proposed mortality and compared them to reserves using a2000 table. In performing the review of the impact to reserves of the IAR Table, the Team compared initial reserves and reserves 10 years after issue for select ages as shown in Tables 18 and 19 below.

Table 18 - Comparison of Reserves at Issue

		Initial Reserves per $1,000 @ 5% Interest			Percentage Increase		
		a2000	2012 w/o Improvement	2012 with Improvement	2012 w/o Improvement	Adding Improvement	Total 2012
Life Annuity at Age 65	Male	11.60	12.37	12.76	6.6%	3.1%	9.9%

EXHIBIT IV

Generational Mortality Table Development

EXHIBIT IV

Example of Generational Mortality Table and Use of Projection Factors

In order to develop generational mortality table rates, the mortality rate for a person age x in year (2012 + n) determined as follows:

$$q_x^{2012+n} = q_x^{2012} * (1 - G2_x)^n$$

where,
- $G2x$ is annual rate of mortality improvement for age x
- q_x is the mortality rate from 2012 Individual Annuity Mortality Period Table

The following table illustrates the development of the 2012 IAR Mortality Table from the 2012 IAM Period Table

Illustration of Development of 2012 IAR Mortality Table, which is a Generation Mortality Table from the 2012 IAM Period Table									

65	q_{65}^{2012}	q_{65}^{2013}	q_{65}^{2014}	q_{65}^{2015}	q_{65}^{2016}	q_{65}^{2017}	q_{65}^{2018}	...	q_{65}^{2070}
66	q_{66}^{2012}	q_{66}^{2013}	q_{66}^{2014}	q_{66}^{2015}	q_{66}^{2016}	q_{66}^{2017}	q_{66}^{2018}	...	q_{66}^{2070}
67	q_{67}^{2012}	q_{67}^{2013}	q_{67}^{2014}	q_{67}^{2015}	q_{67}^{2016}	q_{67}^{2017}	q_{67}^{2018}	...	q_{67}^{2070}
68	q_{68}^{2012}	q_{68}^{2013}	q_{68}^{2014}	q_{68}^{2015}	q_{68}^{2016}	q_{68}^{2017}	q_{68}^{2018}	...	q_{68}^{2070}
69	q_{69}^{2012}	q_{69}^{2013}	q_{69}^{2014}	q_{69}^{2015}	q_{69}^{2016}	q_{69}^{2017}	q_{69}^{2018}	...	q_{69}^{2070}
...	...	...	...	...	...	...	...	...	...
120	q_{120}^{2012}	q_{120}^{2013}	q_{120}^{2014}	q_{120}^{2015}	q_{120}^{2016}	q_{120}^{2017}	q_{120}^{2018}	...	q_{120}^{2070}

The following is an example of the mortality table rates for years 2013 through 2018. The table is based on the 2012 IAM Period Table for Male risks, using Scale G2, for issue years 2013

Age	$1000q_x^{2012}$	$G2_x$	Values of $1000qx$					
			2013	2014	2015	2016	2017	2018
65	8.106	0.015	7.984	7.865	7.747	7.630	7.516	7.403
66	8.548	0.015	8.420	8.293	8.169	8.047	7.926	7.807
67	9.076	0.015	8.940	8.806	8.674	8.544	8.415	8.289
68	9.708	0.015	9.562	9.419	9.278	9.138	9.001	8.866
69	10.463	0.015	10.306	10.151	9.999	9.849	9.701	9.556

[1] Eilers, P.H.C., and Marx, B.D. 1996. "Flexible Smoothing with B-splines and Penalties." Statistical Science 11(2): 89-121.

[2] P-Spline formula denoted as $q(i)x,t = \exp\{\log(q(i)x,t) + Z \times \hat{S}x,t\}$ whereby $q(i)x,t$ is the force of mortality for each age x and for each year t. $\hat{S}x,t$ is the standard deviation of the log mean value of $q(i)x,t$. Z is a standard normal variable for use in generating scenarios. Further details on the P-Spline methodology and the Mortality Projection Spreadsheet v3.0 can be found in the Continuous Mortality Investigation Working Paper 15 (2005), pp. 12-15 and Revised Working Paper 20 produced by The Faculty of Actuaries and Institute of Actuaries.

NAIC MODEL RULE (REGULATION)
FOR RECOGNIZING A NEW ANNUITY MORTALITY TABLE
FOR USE IN DETERMINING RESERVE LIABILITIES FOR ANNUITIES

Table of Contents

Section 1. Authority

This rule is promulgated by the Commissioner of Insurance pursuant to Section [insert applicable reference to the Standard Valuation Law] of the [insert state] Insurance Statute.

Section 2. Purpose

The purpose of this rule is to recognize the following mortality tables for use in determining the minimum standard of valuation for annuity and pure endowment contracts: the 1983 Table "a," the 1983 Group Annuity Mortality (1983 GAM) Table. the Annuity 2000 Mortality Table, the 2012 Individual Annuity Reserving (2012 IAR) Mortality Table, and the 1994 Group Annuity Reserving (1994 GAR) Table.

Section 3. Definitions

A. As used in this rule "1983 Table 'a'" means that mortality table developed by the Society of Actuaries Committee to Recommend a New Mortality Basis for Individual Annuity Valuation and adopted as a recognized mortality table for annuities in June 1982 by the National Association of Insurance Commissioners. [See *1982 Proceedings of the NAIC II*, page 454.]

B. As used in this rule "1983 GAM Table" means that mortality table developed by the Society of Actuaries Committee on Annuities and adopted as a recognized mortality table for annuities in December 1983 by the National Association of Insurance Commissioners. [See *1984 Proceedings of the NAIC I*, pages 414 to 415.]

C. As used in this rule "1994 GAR Table" means that mortality table developed by the Society of Actuaries Group Annuity Valuation Table Task Force and shown on pages 866-867 of Volume XLVII of the *Transactions of the Society of Actuaries* (1995).

D. As used in this rule "Annuity 2000 Mortality Table" means that mortality table developed by the Society of Actuaries Committee on Life Insurance Research and shown on page 240 of Volume XLVII of the *Transactions of the Society of Actuaries* (1995).

E. As used in this rule. "Period table" means a table of mortality rates applicable to a given calendar year (the Period).

F. As used in this rule, "Generational mortality table" means a mortality table containing a set of mortality rates that decrease for a given age from one year to the next based on a combination of a Period table and a projection scale containing rates of mortality improvement.

G. As used in this rule "2012 IAR Mortality Table" means that Generational mortality table developed by the Society of Actuaries Committee on Life Insurance Research and containing rates, q_x^{2012+n}, derived from a combination of the 2012 IAM Period Table and Projection Scale G2, using the methodology stated in Section 5.

H. As used in this rule, "2012 Individual Annuity Mortality Period Life (2012 IAM Period) Table" means the Period table containing loaded mortality rates for calendar year 2012. This table contains rates, q_x^{2012}, developed by the Society of Actuaries Committee on Life Insurance Research and is shown in Appendices 1-2.

I. As used in this rule, "Projection Scale G2 (Scale G2)" is a table of annual rates, $G2_x$, of mortality improvement by age for projecting future mortality rates beyond calendar year 2012. This table was developed by the Society of Actuaries Committee on Life Insurance Research and is shown in Appendices 3-4.

Section 4. Individual Annuity or Pure Endowment Contracts

A. Except as provided in Subsections B and C of this section, the 1983 Table "a" is recognized and approved as an individual annuity mortality table for valuation and, at the option of the company, may be used for purposes of determining the minimum standard of valuation for any individual annuity or pure endowment contract issued on or after [insert effective date of 1976 amendments to the Standard Valuation Law].

B. Except as provided in Subsection C of this section, either the 1983 Table "a" or the Annuity 2000 Mortality Table shall be used for determining the minimum standard of valuation for any individual annuity or pure endowment contract issued on or after [insert date on or after the effective date of original adoption of this regulation].

C. Except as provided in Subsection D of this section, the Annuity 2000 Mortality Table shall be used for determining the minimum standard of valuation for any individual annuity or pure endowment contract issued on or after [insert date on or after effective date of this amended regulation].

D. Except as provided in Subsection E of this section, the 2012 IAR Mortality Table shall be used for determining the minimum standard of valuation for any individual annuity or pure endowment contract issued on or after [insert date on or after effective date of this amended regulation].

E. The 1983 Table "a" without projection is to be used for determining the minimum standards of valuation for an individual annuity or pure endowment contract issued on or after [insert appropriate date on or after the effective date of this amended regulation], solely when the contract is based on life contingencies and is issued to fund periodic benefits arising from:

(1) Settlements of various forms of claims pertaining to court settlements or out of court settlements from tort actions;

(2) Settlements involving similar actions such as worker's compensation claims; or

(3) Settlements of long term disability claims where a temporary or life annuity has been used in lieu of continuing disability payments.

Section 5. Application of the 2012 IAR Mortality Table

In using the 2012 IAR Mortality Table, the mortality rate for a person age x in year (2012 + n) is calculated as follows:

$$q_x^{2012+n} = q_x^{2012}(1 - G2_x)^n$$

The resulting q_x^{2012+n} shall be rounded to three decimal places per 1,000, e.g., 0.741 deaths per 1,000. Also, the rounding shall occur according to the formula above, starting at the 2012 period table rate.

For example, for a male age 30, $q_x^{2012} = 0.741$.
$q_x^{2013} = 0.741 * (1 - 0.010) ^ 1 = 0.73359$, which is rounded to 0.734.
$q_x^{2014} = 0.741 * (1 - 0.010) ^ 2 = 0.7262541$, which is rounded to 0.726.
A method leading to incorrect rounding would be to calculate q_x^{2014} as $q_x^{2013} * (1 - 0.010)$, or 0.734 * 0.99 = 0.727. It is incorrect to use the already rounded q_x^{2013} to calculate q_x^{2014}.

Section 6. Group Annuity or Pure Endowment Contracts

A. Except as provided in Subsections B and C of this section, the 1983 GAM Table, the 1983 Table "a" and the 1994 GAR Table are recognized and approved as group annuity mortality tables for valuation and, at the option of the company, any one of these tables may be used for purposes of valuation for an annuity or pure endowment purchased on or after [insert effective date of 1976 amendments to the Standard Valuation Law] under a group annuity or pure endowment contract.

B. Except as provided in Subsection C of this section, either the 1983 GAM Table or the 1994 GAR Table shall be used for determining the minimum standard of valuation for any annuity or pure endowment purchased on or after [insert date on or after effective date of original adoption of this regulation] under a group annuity or pure endowment contract.

C. The 1994 GAR Table shall be used for determining the minimum standard of valuation for any annuity or pure endowment purchased on or after [insert appropriate date on or after effective date of this amended regulation] under a group annuity or pure endowment contract.

Section 7. Application of the 1994 GAR Table

In using the 1994 GAR Table, the mortality rate for a person age x in year (1994 + n) is calculated as follows:

$$q_x^{1994+n} = q_x^{1994}(1 - AA_x)^n$$

where the q_x^{1994} and AA_x are as specified in the 1994 GAR Table.

Section 8. Separability

If any provision of this rule or its application to any person or circumstances is for any reason held to be invalid, the remainder of the regulation and the application of its provisions to other persons or circumstances shall not be affected.

Section 9. Effective Date

The effective date of this rule is [it is recommended that the amended regulation be effective 1/1/2014].

NAIC MODEL RULE (REGULATION)
FOR RECOGNIZING A NEW ANNUITY MORTALITY TABLE
FOR USE IN DETERMINING RESERVE LIABILITIES FOR ANNUITIES

These charts are intended to provide the readers with additional information to more easily access state statutes, regulations, bulletins or administrative rulings which are related to the NAIC model. Such guidance provides the reader with a starting point from which they may review how each state has addressed the model and the topic being covered. The NAIC Legal Division has reviewed each state's activity in this area and has made an interpretation of adoption or related state activity based on the definitions listed below. The NAIC's interpretation may or may not be shared by the individual states or by interested readers.

This state page does not constitute a formal legal opinion by the NAIC staff on the provisions of state law and should not be relied upon as such. Nor does this state page reflect a determination as to whether a state meets any applicable accreditation standards. Every effort has been made to provide correct and accurate summaries to assist the reader in targeting useful information. For further details, the laws cited should be consulted. The NAIC attempts to provide current information; however, due to the timing of our publication production, the information provided may not reflect the most up to date status. Therefore, readers should consult state law for additional adoptions and subsequent bill status.

NAIC MODEL RULE (REGULATION)
FOR RECOGNIZING A NEW ANNUITY MORTALITY TABLE
FOR USE IN DETERMINING RESERVE LIABILITIES FOR ANNUITIES

KEY:

MODEL ADOPTION: States that have citations identified in this column adopted the most recent version of the NAIC model in a **substantially similar manner.** This requires states to adopt the model in its entirety but does allow for variations in style and format. States that have adopted portions of the current NAIC model will be included in this column with an explanatory note.

RELATED STATE ACTIVITY: States that have citations identified in this column have not adopted the most recent version of the NAIC model in a substantially similar manner. Examples of Related State Activity include but are not limited to: An older version of the NAIC model, legislation or regulation derived from other sources such as Bulletins and Administrative Rulings.

NO CURRENT ACTIVITY: No state activity on the topic as of the date of the most recent update. This includes states that have repealed legislation as well as states that have never adopted legislation.

CHAPTER 84. TABLES APPROVED FOR USE IN DETERMINING MINIMUM NONFORFEITURE STANDARDS AND MINIMUM STANDARDS FOR VALUATION

Sec.

§ 84.2. Definitions.

The following words and terms, when used in this chapter, have the following meanings, unless the context clearly indicates otherwise:

Act—The Insurance Department Act of 1921 (40 P. S. § § 1—321).

Annuity 2000 Mortality Table—The mortality table developed by the Society of Actuaries Committee on Life Insurance Research and shown on page 240 of Volume XLVII of the *Transactions of the Society of Actuaries* (1995) and adopted as a recognized mortality table for annuities in December 1996 by the NAIC.

Commissioner—The Insurance Commissioner of the Commonwealth.

Department—The Insurance Department of the Commonwealth.

Generational mortality table **– A mortality table containing a set of mortality rates that decrease for a given age from one year to the next based on a combination of a period table and a projection scale containing rates of mortality improvement.**

Law—The Insurance Company Law of 1921 (40 P. S. § § 341—991).

NAIC—The National Association of Insurance Commissioners.

Period Table – A table of mortality rates applicable to a given calendar year.

Projection Scale G2 – The table, as shown in Appendices III and IV, of annual rates, $G2_x$, of mortality improvement by age for projecting future mortality rates beyond calendar year 2012 developed by the Society of Actuaries Committee on Life Insurance Research.

1983 Table "a"—The mortality table developed by the Society of Actuaries Committee to Recommend a New Mortality Basis for Individual Annuity Valuation and adopted as a recognized mortality table for annuities in June 1982 by the NAIC.

1983 GAM Table—The mortality table developed by the Society of Actuaries Committee on Annuities and adopted as a recognized mortality table for annuities in December 1983 by the NAIC.

1994 GAR Table—The mortality table developed by the Society of Actuaries Group Annuity Valuation Table Task Force and shown on pages 866—867 of volume XLVII of the *Transactions of the Society of Actuaries* (1995) and adopted as a recognized mortality table for annuities in December 1996 by the NAIC.

2012 IAR Table – The generational mortality table developed by the Society of Actuaries Committee on Life Insurance Research containing rates, q_x^{2012+n}, derived from a combination of the 2012 IAM Period Table and Projection Scale G2, using the methodology stated in section 84.3a.

2012 IAM Period Table – The period table, as shown in Appendices I and II, containing loaded mortality rates for calendar year 2012, q_x^{2012}, developed by the Society of Actuaries Committee on Life Insurance Research.

§ 84.3. 1983 Table "a," Annuity 2000 Mortality Table, 1983 GAM Table**_,_ [and]** 1994 GAR Table**_,_ and 2012 IAR Mortality Table.**

(a) The 1983 Table "a," the Annuity 2000 Mortality Table excluding mortality rates independent of sex, the 1983 GAM Table [and]**_,_** the 1994 GAR Table **and the 2012 IAR Mortality Table** are approved by the Commissioner as annuity mortality tables for valuation.

(b) At the option of the company, the 1983 Table "a" may be used in determining the minimum standard of valuation for an individual annuity or pure endowment contract issued prior to January 1, 1986, and for an annuity or pure endowment purchased prior to January 1, 1986, under a group annuity or pure endowment contract.

(c) The 1983 Table "a," or the Annuity 2000 Mortality Table excluding mortality rates independent of sex shall be used in determining the minimum standard of valuation for an individual annuity or pure endowment contract issued on or after January 1, 1986, and prior to June 26, 1999.

(d) The Annuity 2000 Mortality Table excluding mortality rates independent of sex shall be used, except as provided by subsections (e) **and (f)**, in determining the minimum standard of valuation for an individual annuity or pure endowment contract issued on or after June 26, 1999.

(e) Except as provided in subsection (f), the 2012 IAR Mortality Table shall be used for determining the minimum standard of valuation for any individual annuity or pure endowment contract issued on or after *insert date of effective date of amendments*.

[(e)]**(f)** The 1983 Table "a" shall be used in determining the minimum standard of valuation for an individual annuity or pure endowment contract issued on or after June 26, 1999[.]**,** when the contract is based on life contingencies and is issued to fund periodic benefits arising from:

(1) Settlements of claims pertaining to court settlements or out of court settlements from tort actions.

(2) Settlements of claims, such as worker's compensation claims.

(3) Settlements of long term disability claims when a temporary or life annuity has been used in lieu of continuing disability payments.

[(f)]**(g)** At the option of the company, the 1983 GAM Table or the 1994 GAR Table may be used in determining the minimum standard of valuation for an annuity or pure endowment purchased prior to January 1, 1986, under a group annuity or pure endowment contract.

[(g)]**(h)** The 1983 GAM Table or the 1994 GAR Table shall be used in determining the minimum standard of valuation for an annuity or pure endowment purchased on or after January 1, 1986, and prior to June 26, 1999, under a group annuity or pure endowment contract.

[(h)]**(i)** 1994 GAR Table.

(1) The 1994 GAR Table shall be used in determining the minimum standard of valuation for an annuity or pure endowment purchased on or after June 26, 1999, under a group annuity or pure endowment contract.

(2) In using the 1994 GAR Table, the mortality rate for a person age x in year (1994 + n) shall be calculated as follows:

$q_x^{1994+n} = q_x^{1994} (1-AA_x)^n$ where the values of q_x^{1994} and AA_x are as specified in the 1994 GAR Table.

84.3a. Application of the 2012 IAR Mortality Table.

(a) In using the 2012 IAR Mortality Table, the mortality rate for a person age x in year (2012 + n) is calculated as follows: $q_x^{2012+n} = q_x^{2012}(1 - G2_x)^n$.

(b) The resulting q_x^{2012+n} shall be rounded to three decimal places per 1,000, e.g., 0.741 deaths per 1,000. This rounding shall occur according to the formula above, starting at the 2012 period table rate.

(1) For example, for a male age 30, $q_x^{2012} = 0.741$.
$q_x^{2013} = 0.741 * (1 - 0.010) \wedge 1 = 0.73359$, which is rounded to 0.734.
$q_x^{2014} = 0.741 * (1 - 0.010) \wedge 2 = 0.7262541$, which is rounded to 0.726.

(2) A method leading to incorrect rounding would be to calculate q_x^{2014} as $q_x^{2013} * (1 - 0.010)$, or 0.734 * 0.99 = 0.727. It is incorrect to use the already rounded q_x^{2013} to calculate q_x^{2014}.

Insurance Department

Notice of Proposed Rulemaking

31 Pa. Code Chapter 84

TABLES APPROVED FOR USE IN DETERMINING MINIMUM NONFORFEITURE STANDARDS AND MINIMUM STANDARDS FOR VALUATION

Document/Fiscal Note No. 11-255

INSURANCE COMMISSIONER'S CERTIFICATION

I, Teresa D. Miller, hereby certify that I have reviewed this Proposed Form Regulation and determined that it is consistent with the principles outlined in Executive Order 1996-1.

Teresa D. Miller
Insurance Commissioner

January 11, 2016

Mr. David Sumner
Executive Director
Independent Regulatory Review Comm.
333 Market Street, 14th Floor
Harrisburg, PA 17101

      Re: Insurance Department Proposed Regulation No. 11-255, Tables Approved for Use in
      Determining Minimum Nonforfeiture Standards and Minimum Standards for Valuation

Dear Mr. Sumner:

      Pursuant to Section 5a(c) of the Regulatory Review Act, enclosed for your information and review is proposed regulation 31 Pa. Code, Chapter 84, Tables Approved for Use in Determining Minimum Nonforfeiture Standards and Minimum Standards for Valuation.

      The purpose of this proposed rulemaking is to adopt new mortality tables for use in determining the minimum reserves that insurers must maintain for annuities. The amendments in this proposed rulemaking are based upon changes to NAIC Model Regulation # 821 adopted by the NAIC in 2012.

      If you have any questions regarding this matter, please contact me at (717) 787-2567.

                      Sincerely yours,

                      Bridget E. Burke
                      Bridget E. Burke
                      Regulatory Coordinator
